Portable Hardness Tester

A **portable hardness tester** is a small, light-weight device that measures hardness using several different hardness scales. The hardness of all hardness scales may usually be measured with contemporary portable hardness testers. This tester have the advantage of allowing users to take the equipment with them when measuring samples. You are not required to bring samples to the workshops. **Portable hardness testers** are electronic devices with a number of useful features. For example, the user can save the results of measurements in internal storage, then send the results to a computer to create a control report using specialized software that comes with the hardness testers. Below are two models of the **hardness tester**.

PORTABLE LEEB HARDNESS TESTER

Rebound/Leeb hardness tester is also a portable hardness tester & well-known machine that is intended for quickly measuring metal objects in laboratory, construction, and field conditions.

The equipment is intended for non-destructive testing of production quality and we also use it in metallurgy, mechanical engineering, aircraft, shipbuilding, the nuclear industry, the oil and gas industry.

Portable Leeb Hardness Tester functions by Leeb method.

PORTABLE UCI HARDNESS TESTER

A portable UCI hardness tester is a High precision hardness tester that is intended for quick measuring of metal items' hardness in laboratorial, manufacturing, and field conditions.

The device is intended for non-destructive testing of production quality in metallurgy, mechanical engineering, aircraft, shipbuilding, atomic industry, oil, and gas industry.

Portable UCI Hardness tester functions by UCI method (Ultrasonic Contact Impedance).
